

Information-Theoretic Metric Learning

Jason V. Davis, Brian Kulis, Suvrit Sra, and Inderjit Dhillon

The University of Texas at Austin

December 9, 2006

Presenter: Jason V. Davis

Introduction

- ▶ Problem: Learn a Mahalanobis distance function subject to linear constraints

Introduction

- ▶ Problem: Learn a Mahalanobis distance function subject to linear constraints
- ▶ Information-theoretic viewpoint
 - ▶ Bijection between Gaussian distributions and Mahalanobis distances
 - ▶ Natural entropy-based objective

Introduction

- ▶ Problem: Learn a Mahalanobis distance function subject to linear constraints
- ▶ Information-theoretic viewpoint
 - ▶ Bijection between Gaussian distributions and Mahalanobis distances
 - ▶ Natural entropy-based objective
- ▶ Connections with kernel learning

Introduction

- ▶ Problem: Learn a Mahalanobis distance function subject to linear constraints
- ▶ Information-theoretic viewpoint
 - ▶ Bijection between Gaussian distributions and Mahalanobis distances
 - ▶ Natural entropy-based objective
- ▶ Connections with kernel learning
- ▶ Fast and simple methods
 - ▶ Based on Bregman's method for convex optimization
 - ▶ No eigenvalue computations are needed!

Learning a Mahalanobis Distance

- ▶ Given n points $\{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ in \mathbb{R}^d
- ▶ Given inequality constraints relating pairs of points
 - ▶ Similarity constraints: $d_A(\mathbf{x}_i, \mathbf{x}_j) \leq u$
 - ▶ Dissimilarity constraints: $d_A(\mathbf{x}_i, \mathbf{x}_j) \geq \ell$

Learning a Mahalanobis Distance

- ▶ Given n points $\{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ in \mathbb{R}^d
- ▶ Given inequality constraints relating pairs of points
 - ▶ Similarity constraints: $d_A(\mathbf{x}_i, \mathbf{x}_j) \leq u$
 - ▶ Dissimilarity constraints: $d_A(\mathbf{x}_i, \mathbf{x}_j) \geq \ell$
- ▶ Problem: Learn a Mahalanobis distance that satisfies these constraints:

$$d_A(\mathbf{x}_i, \mathbf{x}_j) = (\mathbf{x}_i - \mathbf{x}_j)^T A (\mathbf{x}_i - \mathbf{x}_j)$$

Learning a Mahalanobis Distance

- ▶ Given n points $\{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ in \mathbb{R}^d
- ▶ Given inequality constraints relating pairs of points
 - ▶ Similarity constraints: $d_A(\mathbf{x}_i, \mathbf{x}_j) \leq u$
 - ▶ Dissimilarity constraints: $d_A(\mathbf{x}_i, \mathbf{x}_j) \geq \ell$
- ▶ Problem: Learn a Mahalanobis distance that satisfies these constraints:

$$d_A(\mathbf{x}_i, \mathbf{x}_j) = (\mathbf{x}_i - \mathbf{x}_j)^T A (\mathbf{x}_i - \mathbf{x}_j)$$

- ▶ Applications
 - ▶ k -means clustering
 - ▶ Nearest neighbor searches

Mahalanobis Distance and the Multivariate Gaussian

- ▶ Problem: How to choose the 'best' Mahalanobis distance from the feasible set?

Mahalanobis Distance and the Multivariate Gaussian

- ▶ Problem: How to choose the 'best' Mahalanobis distance from the feasible set?
- ▶ Solution: Regularize by choosing that which is 'closest' to Euclidean distance

Mahalanobis Distance and the Multivariate Gaussian

- ▶ Problem: How to choose the 'best' Mahalanobis distance from the feasible set?
- ▶ Solution: Regularize by choosing that which is 'closest' to Euclidean distance
- ▶ Bijection between the multivariate Gaussian and the Mahalanobis Distance

$$p(\mathbf{x}; \mathbf{m}, A) = \frac{1}{Z} \exp\left(-\frac{1}{2}(\mathbf{x} - \mathbf{m})^T A(\mathbf{x} - \mathbf{m})\right)$$

Mahalanobis Distance and the Multivariate Gaussian

- ▶ Problem: How to choose the 'best' Mahalanobis distance from the feasible set?
- ▶ Solution: Regularize by choosing that which is 'closest' to Euclidean distance
- ▶ Bijection between the multivariate Gaussian and the Mahalanobis Distance

$$p(\mathbf{x}; \mathbf{m}, A) = \frac{1}{Z} \exp\left(-\frac{1}{2}(\mathbf{x} - \mathbf{m})^T A(\mathbf{x} - \mathbf{m})\right)$$

- ▶ Allows for comparison of two Mahalanobis distances
- ▶ Differential relative entropy between the associated Gaussians:

$$\text{KL}(p(\mathbf{x}; \mathbf{m}_1, A_1) \| p(\mathbf{x}; \mathbf{m}_2, A_2)) = \int p(\mathbf{x}; \mathbf{m}_1, A_1) \log \frac{p(\mathbf{x}; \mathbf{m}_1, A_1)}{p(\mathbf{x}; \mathbf{m}_2, A_2)} d\mathbf{x}.$$

Problem Formulation

Goal: Minimize differential relative entropy subject to pairwise inequality constraints

$$\begin{aligned} \min \quad & \text{KL}(p(\mathbf{x}; \mathbf{m}, A) \| p(\mathbf{x}; \mathbf{m}, I)) \\ \text{subject to} \quad & d_A(\mathbf{x}_i, \mathbf{x}_j) \leq u \quad (i, j) \in S, \\ & d_A(\mathbf{x}_i, \mathbf{x}_j) \geq \ell \quad (i, j) \in D \\ & A \succ 0 \end{aligned}$$

Overview: Optimizing the Model

- ▶ Show an equivalence between our problem and a low-rank kernel learning problem [Kulis, 2006]
 - ▶ Yields closed-form solutions to compute the problem objective
 - ▶ Shows that the problem is convex

Overview: Optimizing the Model

- ▶ Show an equivalence between our problem and a low-rank kernel learning problem [Kulis, 2006]
 - ▶ Yields closed-form solutions to compute the problem objective
 - ▶ Shows that the problem is convex
- ▶ Use this equivalence to solve our problem efficiently

Low-Rank Kernel Learning

- ▶ Given $X = [\mathbf{x}_1 \ \mathbf{x}_2 \ \dots \ \mathbf{x}_n]$, $\mathbf{x}_i \in \mathbb{R}^d$, define $K_0 = X^T X$
- ▶ Constraints: similarity (S) or dissimilarity (D) between pairs of points
- ▶ Objective: Learn K that minimizes the divergence to K_0

Low-Rank Kernel Learning

- ▶ Given $X = [\mathbf{x}_1 \ \mathbf{x}_2 \ \dots \ \mathbf{x}_n]$, $\mathbf{x}_i \in \mathbb{R}^d$, define $K_0 = X^T X$
- ▶ Constraints: similarity (S) or dissimilarity (D) between pairs of points
- ▶ Objective: Learn K that minimizes the divergence to K_0

$$\begin{aligned} \min \quad & D_{\text{Burg}}(K, K_0) \\ \text{subject to} \quad & K_{ii} + K_{jj} - 2K_{ij} \leq u \quad (i, j) \in S, \\ & K_{ii} + K_{jj} - 2K_{ij} \geq \ell \quad (i, j) \in D, \\ & K \succeq 0 \end{aligned}$$

- ▶ D_{Burg} is the Burg divergence

$$D_{\text{Burg}}(K, K_0) = \text{Tr}(KK_0^{-1}) - \log \det(KK_0^{-1}) - n$$

Equivalence to Kernel Learning

[Kulis, 2006] Let K be the optimal solution to the low-rank kernel learning problem.

- ▶ Then K has the same range space as K_0
- ▶ $K = X^T W^T W X$

Equivalence to Kernel Learning

[Kulis, 2006] Let K be the optimal solution to the low-rank kernel learning problem.

- ▶ Then K has the same range space as K_0
- ▶ $K = X^T W^T W X$

Theorem: Let $K = X^T W^T W X$ be an optimal solution to the low-rank kernel learning problem.

- ▶ Then $A = W^T W$ is an optimal solution to the corresponding metric learning problem

Proof Sketch

Lemma 1: $D_{\text{Burg}}(K, K_0) = 2\text{KL}(p(\mathbf{x}; \mathbf{m}, A) \| p(\mathbf{x}; \mathbf{m}, I)) + c$

- ▶ Establishes that the objectives for the problem are the same
- ▶ Builds on a recent connection relating the relative entropy between Gaussians and the Burg divergence [Davis, 2006]

Proof Sketch

Lemma 1: $D_{\text{Burg}}(K, K_0) = 2\text{KL}(p(\mathbf{x}; \mathbf{m}, A) \| p(\mathbf{x}; \mathbf{m}, I)) + c$

- ▶ Establishes that the objectives for the problem are the same
- ▶ Builds on a recent connection relating the relative entropy between Gaussians and the Burg divergence [Davis, 2006]

Lemma 2: Given $K = X^T A X$, A is feasible if and only if K is feasible

Optimization via Bregman's Method

- ▶ Solve the associated kernel learning problem via Bregman's method
 - ▶ Dual ascent method
 - ▶ Iteratively projects onto one constraint at a time
 - ▶ Closed-form updates are known for this projection

Optimization via Bregman's Method

- ▶ Solve the associated kernel learning problem via Bregman's method
 - ▶ Dual ascent method
 - ▶ Iteratively projects onto one constraint at a time
 - ▶ Closed-form updates are known for this projection
- ▶ Running time per iteration: $O(cd^2)$
 - ▶ Works on the kernel in factored form
 - ▶ Uses closed-form Bregman projections

Optimization via Bregman's Method

- ▶ Solve the associated kernel learning problem via Bregman's method
 - ▶ Dual ascent method
 - ▶ Iteratively projects onto one constraint at a time
 - ▶ Closed-form updates are known for this projection
- ▶ Running time per iteration: $O(cd^2)$
 - ▶ Works on the kernel in factored form
 - ▶ Uses closed-form Bregman projections
- ▶ Requires no eigenvalue decomposition

Extensions

- ▶ Minimizing KL -divergence to a different Mahalanobis matrix
 - ▶ inverse of the sample covariance matrix

Extensions

- ▶ Minimizing KL -divergence to a different Mahalanobis matrix
 - ▶ inverse of the sample covariance matrix
- ▶ Slack variables

Extensions

- ▶ Minimizing KL -divergence to a different Mahalanobis matrix
 - ▶ inverse of the sample covariance matrix
- ▶ Slack variables
- ▶ General linear inequality constraints
 - ▶ e.g. Relative distance comparisons [Schutz, 2003]

Experimental Methodology

- ▶ Goal: learn a Mahalanobis function for kNN classification

Experimental Methodology

- ▶ Goal: learn a Mahalanobis function for kNN classification
- ▶ Approach:
 - ▶ Constrain points in the same class to be similar
 - ▶ Constrain points in different class to be dissimilar
 - ▶ Upper and lower bounds determined empirically

Experimental Methodology

- ▶ Goal: learn a Mahalanobis function for kNN classification
- ▶ Approach:
 - ▶ Constrain points in the same class to be similar
 - ▶ Constrain points in different class to be dissimilar
 - ▶ Upper and lower bounds determined empirically
 - ▶ Sample 100 such constraints
 - ▶ No parameter tuning

Experimental Methodology

- ▶ Goal: learn a Mahalanobis function for kNN classification
- ▶ Approach:
 - ▶ Constrain points in the same class to be similar
 - ▶ Constrain points in different class to be dissimilar
 - ▶ Upper and lower bounds determined empirically
 - ▶ Sample 100 such constraints
 - ▶ No parameter tuning
- ▶ Evaluate via cross-validation

Experimental Results

- ▶ ITML: Information-Theoretic Metric Learning
- ▶ Sample Cov: parametrize Mahalanobis distance by the inverse of the sample covariance of the data
- ▶ LDA: Linear Discriminant Analysis
- ▶ MCML: Maximally Collapsing Metric Learning [Globerson, 2005]

Conclusion

- ▶ Presented an information-theoretic formulation for metric learning
- ▶ Given an equivalence between this problem and low-rank kernel learning
- ▶ Provided efficient algorithms
- ▶ Experiments are promising, but much more work is needed!
